## Условие

Составить программу на языке Си, обрабатывающую данные в многопоточном режиме. При обработке использовать стандартные средства создания потоков операционной системы (Windows/Unix). Ограничение максимального количества потоков, работающих в один момент времени, должно быть задано ключом запуска вашей программы. Так же необходимо уметь продемонстрировать количество потоков, используемое вашей программой с помощью стандартных средств операционной системы.

## Цель работы

Изучение механизмов управления потоками и обеспечение их синхронизации.

## Задание

Есть  $K$  массивов одинаковой длины. Необходимо сложить эти массивы. Необходимо предусмотреть стратегию, адаптирующуюся под количество массивов и их длину.

## Вариант

8

## Метод решения

Данная программа реализует многопоточное поэлементное сложение  $K$  вещественных массивов одинаковой длины  $L$  с использованием библиотеки POSIX Threads (pthreads) и адаптивной стратегией распределения нагрузки.

Основной алгоритм:

- Генерируются  $K$  массивов длиной  $L$  с случайными значениями.
- Задача разбивается на блоки индексов, каждый поток суммирует элементы в своём диапазоне по всем  $K$  массивам.
- Число одновременно активных потоков ограничено параметром `max_threads`, заданным через аргумент командной строки.
- Каждый поток использует локальный буфер для промежуточных сумм, исключая гонки на этапе вычислений.
- Слияние результатов в общий вектор защищено мьютексом.
- Семафор ограничивает количество одновременно выполняющихся потоков.

Ключевые компоненты:

- `ArrayManager` — хранение и генерация массивов
- `ParallelSummer` — ядро параллельного суммирования (разбиение, потоки, синхронизация)

Системные вызовы (POSIX):

`pthread_create`, `pthread_join`,  
`pthread_mutex_init/lock/unlock/destroy`,  
`sem_init`, `sem_wait`, `sem_post`, `sem_destroy`,  
`getpid()`

Программа использует объектно-ориентированный подход с инкапсуляцией и RAII-подобным управлением ресурсами (мьютексы и семафоры уничтожаются в деструкторе).

## Описание программы

Программа реализует эффективное многопоточное сложение  $K$  массивов длины  $L$  с динамической адаптацией числа потоков и строгим контролем над их количеством.

`main.cpp` — точка входа:

- парсит аргумент `max_threads`,
- создаёт объект `ArrayManager`, заполняет массивы случайными числами,
- выводит PID процесса для мониторинга потоков (`ps -T -p <pid>`),
- запускает `ParallelSummer`,
- выводит первые 10 элементов результата.

`ArrayManager (ArrayManager.h/.cpp)` —

- инкапсулирует  $K \times L$  массивов в `std::vector<std::vector<double>`,
- реализует равномерное заполнение случайными значениями.

`ParallelSummer (ParallelSummer.h/.cpp)` —

- хранит ссылку на входные данные и вектор результата,
- содержит `pthread_mutex_t` и `sem_t`,
- динамически вычисляет число потоков и размеры блоков,
- создаёт потоки через `pthread_create`,
- каждый поток выполняет функцию `sumRange` с локальными суммами,
- обеспечивает потокобезопасную агрегацию и освобождение ресурсов.

Сборка осуществляется через `CMakeLists.txt` с обязательной линковкой `-lpthread`.

## Результаты

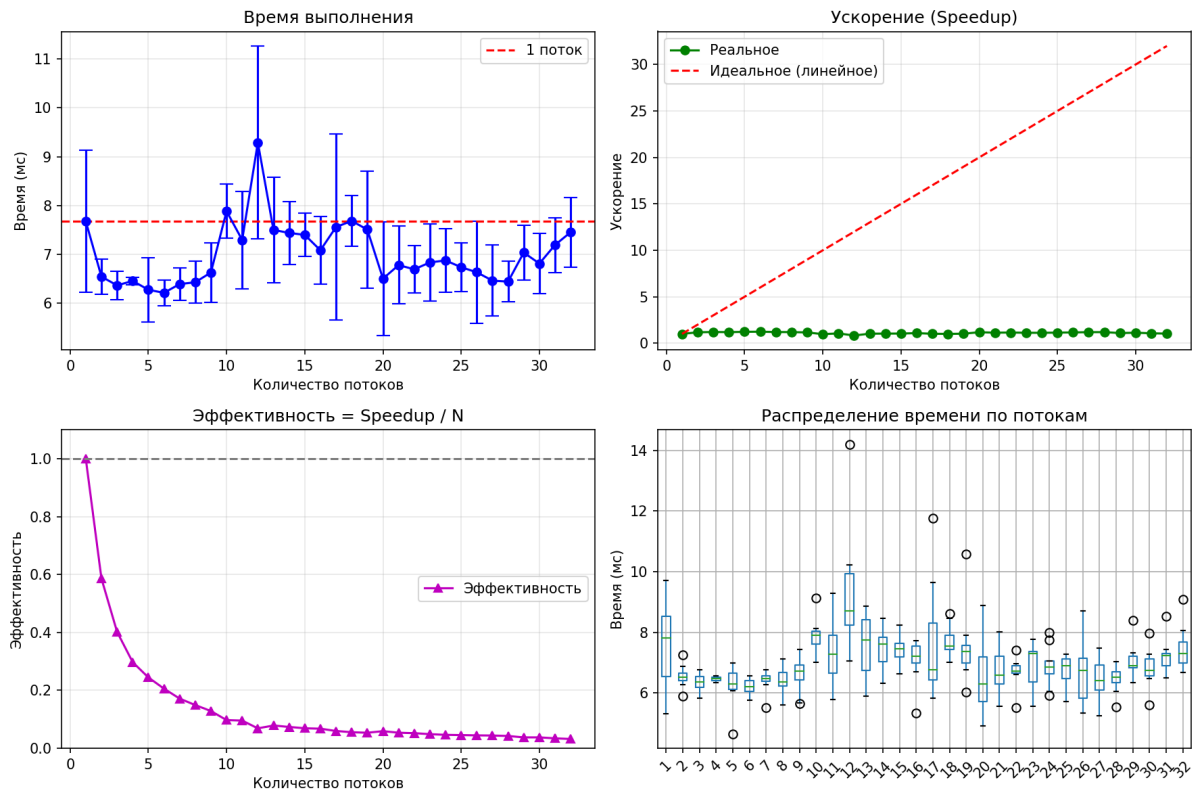

Разработанная программа успешно выполняет поставленную задачу обработки текстовых данных с помощью многопоточной обработки.

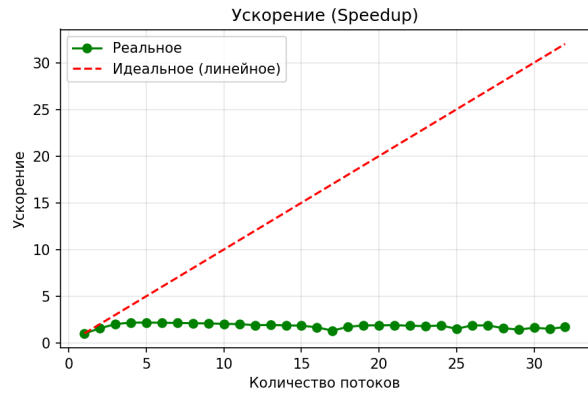

В ходе решения были достигнуты следующие ключевые результаты:

Корректная работа системы

Реализовано параллельное суммирование

автоматическая адаптация количества потоков под размер задачи и заданное ограничение по числу

## Выводы

В ходе лабораторной работы успешно разработана и реализована эффективная, потоко-безопасная и адаптивная программа параллельного сложения массивов с использованием классических механизмов POSIX.

## Исходная программа

Листинг 1: src/main.cpp — точка входа, парсинг аргументов, запуск параллельного суммирования
